INTRODUCTION

The *Statistical Abstract of Colorado, 1976 - 77* is an unofficial summary of statistics about the state of Colorado — its population, resources, environment, and government institutions.

It is designed first as a single-volume collection for statistical reference, but it may be used as a guide to published sources containing information about Colorado by consulting the source references that accompany each table.

The compiler has attempted to use information that was current in published and available sources as of the last quarter of 1976 or early 1977. Effort was made to gather statisitcal data on a variety of subjects from a combination of government and private publications. No claim is made that the result is comprehensive. While care was taken to insure accuracy in transcribing data from original source to worksheet and from that into type, errors are certain to exist. The compiler and publisher therefore assume responsibility only for the editorial selection of the information contained and not for its accuracy or reliability.

Users of this publication are encouraged to consult the cited sources or the *Statistical Abstract of the United States* (Washington, Government Printing Office, Annual) for definitions and explanations of statistical methodology. The outline of chapters in the *Statistical Abstract of Colorado* follows closely that of the national publication which contains narrative introductions to each subject section that are generally appropriate for this work on Colorado.

The *Statistical Abstract of Colorado, 1976 - 77* has been produced privately. No support has been sought, extended or received from any government, educational institution or private business.

The idea to compile a collection of statistical data about Colorado resulted directly from experience as a general reference librarian at the University of Denver, where, as in other Colorado libraries, there is a consistent demand for basic statistical information about Colorado. While this information is often available, especially in the larger libraries with sizeable collections of U.S. government publications, its identification and retrieval often have required the use of a number of separate publications. The decision to bring out a one volume collection of statistical information followed after it was determined that the State of Colorado had no intention to revive the excellent *Colorado Yearbook*, which ceased publication with the 1962-1964 edition—the twenty-sixth and last edition of a publication that survived forty-six years.

Two important limitations affected the resulting publication — time and fiscal resources. The *Statistical Abstract of Colorado* is a product of disconnected hours and days that bracket a full-time position at the University of Denver. The necessity to insure that the costs of printing, marketing, and distribution be recovered, required that relatively inefficient methods of production be used including the use of a small offset duplicator, diffusion process plates, and the uneven technical skills of a librarian acting briefly as graphic designer, typesetter, platemaker, printer, binder and small businessman. Yet, it is only with the unpaid assistance and frequent encouragement of some very special people that the project was completed.

The index, which has to be the key to the information contained in this compilation, is the thoughtful product of a good friend and professional colleague at the University of Denver, Sallye Smith. Another good friend, Brenda Kelly, has given freely of her time in several production areas. While this book carries no dedication, I would like to acknowledge the consistent encouragement and support of my wife, Marjorie M. Tyler, through all that was required to move from idea to finished product.

* Average compensation for professional resident instruction staff (9 month year).

** "On Campus Cost per FTE" is the on-campus operating cost of providing instruction including such categories of cost as resident instruction, administration, student services, librarians, books and periodical purchases, state-supported ADP operations, museums, plant operation and maintenance, organized research and organized activities related to instruction. All costs of capital outlay, extension services, rentals, and extraordinary items are excluded from the "on-campus cost". Tuitions are calculated on the basis of cost less any reimbursements received for overhead or vocational costs.

Notes: * – Colorado has two air quality standards for suspended particulates: the first applies to "designated areas" at 70 micrograms per cubic meter and the second is 45 micrograms per cubic meter for "non-designated areas". Most stations are located in the first category. Stations not in the following counties are subject to the lower standard: Adams, Arapahoe, Boulder, Denver, Douglas, El Paso, Jefferson, Larimer, Las Animas, Mesa, Pueblo, and Weld. These standards are for one year arithmetic mean concentration.

** – Data not available in source publication.

Letter codes – SC = station closed; ID = insufficient data; NS = no samples; ( ) average based on limited available data.

One of the significant differences that should be mentioned here is that unlike the Bureau of the Census which uses previous year's income to estimate the following year's personal income, this method uses "same year" data.

† Equals the sum of wages, other labor income, and proprietor's income.

This measure of personal income differs from that of the U. S. Bureau of the Census. The source publication contains detailed information on methodology. One of the significant differences that should be mentioned here is that unlike the Bureau of the Census which uses previous year's income to estimate the following year's personal income, this method uses "same year" data.

Note: the payroll and sales data for small establishments (generally single-unit companies with less than 10 employees) were obtained from administrative records of other government agencies instead of from a census report form. These data were then used in conjunction with industry averages to estimate the balance of the items shown in the table for these small establishments. This technique was also used for a small number of other establishments whose reports were not received at the time the data were tabulated. The following symbols are shown where administrative records data were used and account for 10 percent or more of the figures shown:

E1–10 to 19 percent	E3–30 to 39 percent	E5–50 to 59 percent	E7–70 to 79 percent	E9–90 to 99 percent
E2–20 to 29 percent	E4–40 to 49 percent	E6–60 to 69 percent	E8–80 to 89 percent	E10–100 percent

*FEW–"Factor Effect and Weight" indicates the relative value the author of this report has assigned to each factor. It is included here to provide a perspective to the results of Mr. Ben-Chieh Liu's study which are presented in the table that follows. The source should be consulted for definitions and descriptions of methodology.

**–data either not available or not applicable.

[1] Data used in the study used two figures for different sized SMSA's: $414.90 for the medium and large SMSA's and $486.00 for the small SMSA's.

†Data so indicated in the "All" columns have the following meaning. Where "value" is indicated the figure represents the mean and where "rating" is indicated the figure represents the standard deviation for that component. The technique used by the analyst for assigning ratings of cities assigned the category "outstanding" to those instances where there was a standard deviation of one or more; where there was a negative standard deviation of one or more the rank assigned was "substandard". Three categories filled in the center range–"Excellent, Good, and Adequate".
